

HEIDENHAIN

Length Gauges

April 2015

Length gauges from HEIDENHAIN offer high accuracy over long measuring ranges. These sturdily made gauges are available in application-oriented versions.

They have a wide range of applications in production metrology, in multipoint inspection stations, measuring equipment monitoring, and as position measuring devices.

This catalog supersedes all previous editions, which thereby become invalid. The basis for ordering from HEIDENHAIN is always the catalog edition valid when the contract is made.

Standards (ISO, EN, etc.) apply only where explicitly stated in the catalog.

The Interfaces of HEIDENHAIN Encoders brochure, ID 1078628-xx, includes comprehensive descriptions of all available interfaces as well as general electrical information.

Areas of application

In quality assurance

Metrology and production control

Length gauges from HEIDENHAIN play a role in incoming goods inspection, fast dimension checking during production, statistical process control in production or quality assurance, or in any application where fast, reliable and accurate length measurement is required. Their large measuring lengths are a particular advantage: whether the part measures 5 mm or 95 mm, it is measured immediately with one and the same length gauge.

Whatever the application, HEIDENHAIN has the appropriate length gauge for the required accuracy. The **HEIDENHAIN-CERTO** length gauges offer a very high accuracy of $\pm 0.1 \mu\text{m}/\pm 0.05 \mu\text{m}^*/\pm 0.03 \mu\text{m}^*$ for extremely precise measurement. Length gauges from the **HEIDENHAIN-METRO** program have accuracy grades as fine as $\pm 0.2 \mu\text{m}$, while the **HEIDENHAIN-SPECTO** length gauges, with $\pm 1 \mu\text{m}$ accuracy, offer particularly compact dimensions.

Gauge block calibration and measuring device inspection

The regular inspection of measuring equipment called for by standards, and the inspection of gauge blocks in particular, necessitate a large number of reference standard blocks if the comparative measurement is performed using inductive gauges. The problem is the small measuring range of inductive gauges: they can measure length differences of only up to $10 \mu\text{m}$. Length gauges, which offer large measuring ranges together with high accuracy, greatly simplify the calibration of measuring devices required to ensure traceability.

The length gauges of the **HEIDENHAIN-CERTO** program with measuring ranges of 25 mm with $\pm 0.1 \mu\text{m}/\pm 0.03 \mu\text{m}^*$ accuracy and 60 mm with $\pm 0.1 \mu\text{m}/\pm 0.05 \mu\text{m}^*$ accuracy are especially well suited for this task. It permits a significant reduction in the required number of reference standard blocks, and recalibrating becomes much simpler.

Inspection of styli

Calibration of gauge blocks

In production

Multipoint inspection apparatuses

Multipoint inspection apparatuses require durable length gauges with small dimensions. They should also have relatively large measuring ranges of several millimeters with consistent linear accuracy in order to simplify the construction of inspection devices—for example by enabling the construction of one device for several masters. A large measuring length also provides benefits in master production, because simpler masters can be used.

Thanks to their small dimensions, the **HEIDENHAIN-ACANTO** absolute length gauges, like the **HEIDENHAIN-SPECTO** incremental length gauges, are specially designed for multi-point measuring stations. They feature accuracy grades up to $\pm 1 \mu\text{m}$ over measuring ranges up to 30 mm. Higher accuracy requirements up to $\pm 0.2 \mu\text{m}$ can be met with similarly compact **HEIDENHAIN-METRO** length gauges.

Unlike inductive gauges, HEIDENHAIN-SPECTO length gauges provide stable measurement over long periods—eliminating recalibration.

Position measurement

Length gauges from HEIDENHAIN are also ideal for position measurement on precision linear slides and X-Y tables. Working with measuring microscopes, for example, becomes much easier thanks to the digital readout and the flexible datum setting.

Here, length gauges from the **HEIDENHAIN-METRO** and **HEIDENHAIN-SPECTO** program come into use with large measuring ranges of 30 mm, 60 mm or 100 mm at consistently high accuracy grades of $\pm 0.5 \mu\text{m}$ or $\pm 1 \mu\text{m}$.

In this application as linear measuring device, the length gauge's fast installation in accordance with the Abbe measuring principle by its clamping shank or planar mounting surface is of special benefit.

Length gauges from HEIDENHAIN

A number of arguments speak for HEIDENHAIN length gauges. These include not only their technical features, but also their high quality standard and the worldwide presence of HEIDENHAIN.

Large measuring ranges

HEIDENHAIN length gauges are available with measuring lengths of 12 mm, 25 mm, 30 mm, 60 mm or 100 mm. so that you can measure very different parts in one measuring setup and avoid frequently changing setups with expensive gauge blocks or masters.

High accuracy

The high accuracy specified for HEIDENHAIN length gauges applies over the entire measuring length. Whether the part measures 10 mm or 100 mm, its actual dimension is always measured with the same high quality. The high repeatability of HEIDENHAIN length gauges comes into play during comparative measurements, for example in series production.

In particular HEIDENHAIN-CERTO length gauges provide high linear accuracy and offer resolution in the nanometer range.

Robust design

HEIDENHAIN length gauges are built for an industrial environment. They feature consistently high accuracy over a long period of time as well as high thermal stability. They can therefore be used in production equipment and machines.

Wide range of applications

HEIDENHAIN length gauges are suited for many applications. Automatic inspection equipment, manual measuring stations or positioning equipment—wherever lengths, spacing, thickness, height or linear motion are to be measured, HEIDENHAIN length gauges function quickly, reliably and accurately.

Absolute position measurement

HEIDENHAIN-ACANTO length gauges operate with absolute measurement over a range of 12 mm or 30 mm and with high repeatability. Its particular advantage is that the measured value is available immediately after switch-on.

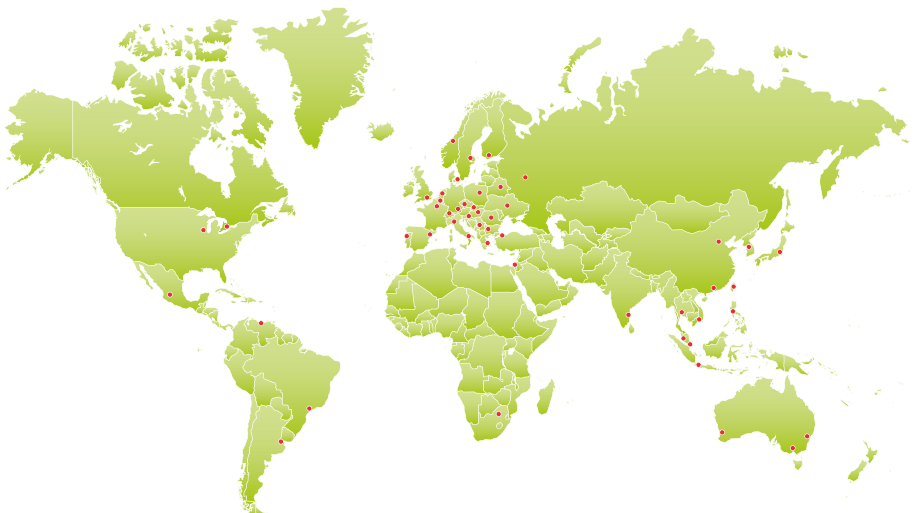

Know-how

The high quality of HEIDENHAIN length gauges is no coincidence. HEIDENHAIN has been manufacturing high-accuracy scales for over 70 years, and for many years it has developed measuring and testing devices for length and angle laboratories. This know-how makes HEIDENHAIN an extraordinarily qualified partner for metrology questions.

Worldwide presence

HEIDENHAIN is represented in all important industrial countries—in most of them with wholly owned subsidiaries. Sales engineers and service technicians support the user on-site with technical information and servicing in the local language.

Measuring principles

Measuring standard

HEIDENHAIN length gauges are characterized by long measuring ranges and consistently high accuracy. The basis for both is the photoelectrical scanning principle.

HEIDENHAIN length gauges use material measuring standards consisting of absolute or incremental graduations on substrates of glass or glass ceramic. These measuring standards permit large measuring ranges, are insensitive to vibration and shock, and have a defined thermal behavior. Changes in atmospheric pressure or relative humidity have no influence on the accuracy of the measuring standard—which is the prerequisite for the **high long-term stability** of HEIDENHAIN length gauges.

HEIDENHAIN manufactures the precision graduations in specially developed, photolithographic processes.

- AURODUR: matte-etched lines on gold-plated steel tape with typical graduation period of 40 μm
- METALLUR: contamination-tolerant graduation of metal lines on gold, with typical graduation period of 20 μm
- DIADUR: extremely robust chromium lines on glass (typical graduation period of 20 μm) or three-dimensional chromium structures (typical graduation period of 8 μm) on glass
- SUPRADUR phase grating: optically three dimensional, planar structure; particularly tolerant to contamination; typical graduation period of 8 μm and finer
- OPTODUR phase grating: optically three dimensional, planar structure with particularly high reflectance, typical graduation period of 2 μm and less

Along with these very fine grating periods, these processes permit a high definition and homogeneity of the line edges. Together with the photoelectric scanning method, this high edge definition is a precondition for the high quality of the output signals.

The master graduations are manufactured by HEIDENHAIN on custom-built high-precision dividing engines.

Measurement procedure

With the **incremental measuring method**, the graduation consists of a periodic grating structure. The position information is obtained **by counting** the individual increments (measuring steps) from some point of origin. Since an absolute reference is required to ascertain positions, the measuring standard is provided with an additional track that bears a **reference mark**. The absolute position on the scale, established by the reference mark, is gated with exactly one signal period.

The reference mark must therefore be scanned to establish an absolute reference or to find the last selected datum.

With the **absolute measuring method**, the position value is available from the encoder immediately upon switch-on and can be called at any time by the subsequent electronics. There is no need to move the axes to find the reference position. The absolute position information is read **from the graduated disk**, which is formed from a serial absolute code structure. A separate incremental track is interpolated for the position value and at the same time—depending on the interface version—is used to generate an optional incremental signal.

DIADUR phase grating with approx. 0.25 μm grating height

Photoelectric scanning

Most HEIDENHAIN encoders operate using the principle of photoelectric scanning. Photoelectric scanning of a measuring standard is contact-free, and as such, free of wear. This method detects even very fine lines, no more than a few microns wide, and generates output signals with very small signal periods.

The finer the grating period of a measuring standard is, the greater the effect of diffraction on photoelectric scanning. HEIDENHAIN uses two scanning principles with linear encoders:

- The **imaging scanning principle** for grating periods of 20 μm and 40 μm
- The **interferential scanning principle** for very fine graduations with grating periods of, for example, 8 μm

DIADUR graduation

Imaging principle

To put it simply, the imaging scanning principle functions by means of projected-light signal generation: two scale gratings with equal or similar grating periods are moved relative to each other—the scale and the scanning reticle. The carrier material of the scanning reticle is transparent, whereas the graduation on the measuring standard may be applied to a transparent or reflective surface.

When parallel light passes through a grating, light and dark surfaces are projected at a certain distance. An index grating is located here. When the two gratings move relative to each other, the incident light is modulated. If the gaps in the gratings are aligned, light passes through. If the lines of one grating coincide with the gaps of the other, no light passes through. An array of photovoltaic cells converts these variations in light intensity into electrical signals. The specially structured grating of the scanning reticle filters the light to generate nearly sinusoidal output signals.

The smaller the period of the grating structure is, the closer and more tightly tolerated the gap must be between the scanning reticle and scale.

The HEIDENHAIN-ACANTO, HEIDENHAIN-SPECTO and the HEIDENHAIN-METRO length gauges of the MT 60 and MT 100 series operating according to the imaging principle.

Imaging principle

Interferential scanning principle

The interferential scanning principle exploits the diffraction and interference of light on a fine graduation to produce signals used to measure displacement.

A step grating is used as the measuring standard: reflective lines 0.2 μm high are applied to a flat, reflective surface. In front of that is the scanning reticle—a transparent phase grating with the same grating period as the scale.

When a light wave passes through the scanning reticle, it is diffracted into three partial waves of the orders -1, 0, and +1, with approximately equal luminous intensity. The waves are diffracted by the scale such that most of the luminous intensity is found in the reflected diffraction orders +1 and -1. These partial waves meet again at the phase grating of the scanning reticle where they are diffracted again and interfere. This produces essentially three waves that leave the scanning reticle at different angles. Photovoltaic cells convert this alternating light intensity into electrical signals.

A relative motion of the scanning reticle to the scale causes the diffracted wave fronts to undergo a phase shift: when the grating moves by one period, the wave front of the first order is displaced by one wavelength in the positive direction, and the wavelength of diffraction order -1 is displaced by one wavelength in the negative direction. Since the two waves interfere with each other when exiting the grating, the waves are shifted relative to each other by two wavelengths. This results in two signal periods from the relative motion of just one grating period.

Interferential encoders function with grating periods of, for example, 8 μm, 4 μm and finer. Their scanning signals are largely free of harmonics and can be highly interpolated. These encoders are therefore especially suited for high resolution and high accuracy.

The HEIDENHAIN-CERTO and the HEIDENHAIN-METRO length gauges of the MT 1200 and MT 2500 series operating according to the interferential principle.

Interferential scanning principle (optics schematics)

- C Grating period
- ψ Phase shift of the light wave when passing through the scanning reticle
- Ω Phase shift of the light wave due to motion X of the scale

Measuring accuracy

The accuracy of linear measurement is mainly determined by

- the quality of the graduation,
- the quality of the scanning process,
- the quality of the signal processing electronics,
- the eccentricity of the graduation to the bearing,
- the error from the scale guideway relative to the scanning unit, and
- the orthogonality of the length gauge to the bearing surface.

These factors of influence are comprised of encoder-specific error and application-dependent issues. All individual factors of influence must be considered in order to assess the attainable **overall accuracy**.

Error specific to the measuring device

The error that is specific to the measuring device is shown in the Specifications as the **system accuracy**.

*The extreme values of the **total error F** with reference to their mean value lie over the entire measuring length within the system accuracy $\pm a$. They are measured during the final inspection and documented in the calibration chart.*

The system accuracy includes

- the homogeneity and period definition of the graduation,
- the alignment of the graduation,
- the error of the bearing, and
- the position error within one signal period.

Position error within one signal period

Position errors within one signal period already become apparent in very small motions and in repeated measurements. They are therefore considered separately.

The position error within one signal period $\pm u$ results from the quality of the scanning and—for encoders with integrated pulse-shaping or counter electronics—the quality of the signal-processing electronics. For encoders with sinusoidal output signals, however, the errors of the signal processing electronics are determined by the subsequent electronics.

The following individual factors influence the result:

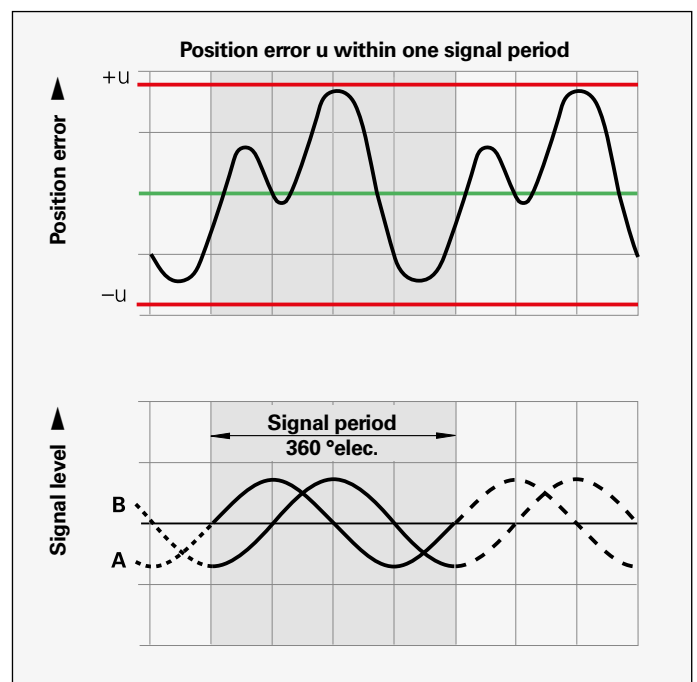

- The size of the signal period
- The homogeneity and period definition of the graduation
- The quality of scanning filter structures
- The characteristics of the sensors
- The stability and dynamics of further processing of the analog signals

These deviations are to be considered when specifying position error within one signal period.

Position error within one signal period $\pm u$ is specified in percent of the signal period. For length gauges, the value is typically better than $\pm 1\%$ of the signal period. You will find the specified values in the Specifications.

Short-range accuracy

The short-range accuracy describes an error that occurs within a distance of $\pm 100 \mu\text{m}$ from a measuring point. It includes electronic and mechanical influences of the gauge on the result of measurement. The values for short-range accuracy typically lie below the specified values.

Application-dependent error

Other factors besides the system accuracy also influence the attainable total accuracy of measurement. These include in particular the ambient temperature and temperature fluctuations during measurement as well as a stable, orthogonal measuring setup.

All components included in the **measuring loop**, such as the holder for the measured object, the gauge stand with holder, and the length gauge itself, influence the result of measurement. Expansion or deformation of the measuring setup through mechanical or thermal influences adds directly to the error.

Mechanical design

A stable measuring assembly must be ensured. Long lateral elements within the measuring loop are to be avoided. HEIDENHAIN offers a stable gauge stand as an accessory. The force resulting from the measurement must not cause any measurable deformation of the measuring loop.

Length gauges from HEIDENHAIN operate with small gauging force and have very little influence on the measuring setup.

The measuring loop: All components involved in the measuring assembly, including the length gauge

Orthogonal mounting

The length gauge is to be mounted so that its plunger is exactly orthogonal to the measured object or the surface on which it rests. Deviations result in measuring error.

The accessory HEIDENHAIN gauge stands with holders for an **8 mm clamping shank** ensure orthogonal mounting. Length gauges that provide **planar mounting surfaces** are to be adjusted in the direction parallel to the mounting surface (Y) to be perpendicular to the measuring plate. A quick and reliable adjustment is possible with the aid of a gauge block or a parallel block. The perpendicularity to the measuring table (X) is already ensured by the gauge stand.

Orthogonal mounting

Thermal characteristics

Temperature variations during measurement cause changes in length or deformation of the measuring setup. After a change in temperature of 5 K, a steel bar of 200 mm length expands by 10 μm .

Length changes resulting from a uniform deviation from the reference temperature can largely be compensated by resetting the datum on the measuring plate or a master; only the expansion of the scale and measured object go into the result of measurement.

Temperature changes during measurement cannot be ascertained mathematically. For critical components, HEIDENHAIN therefore uses special materials with low coefficients of expansion, such as are found in the HEIDENHAIN-CERTO gauge stand. This makes it possible to guarantee the high accuracy of HEIDENHAIN-CERTO even at ambient temperatures of 19 °C to 21 °C and variations of ± 0.1 K during measurement.

In order to measure with complete accuracy, the length gauge should be switched on approximately 15 minutes before the first measurement.

Thermally induced change in length:

Expansion of the measuring loop components as a result of heat

Calibration chart

All HEIDENHAIN length gauges are inspected before shipping for accuracy and proper function.

They are calibrated for accuracy during retraction and extension of the plunger. For HEIDENHAIN-CERTO gauges, the number of measuring positions is selected to ascertain very exactly not only the long-range error, but also the position error within one signal period.

The **Quality Inspection Certificate** confirms the specified system accuracy of each length gauge. The **calibration standards** ensure the traceability—as required by EN ISO 9001—to recognized national or international standards.

For the HEIDENHAIN-METRO and HEIDENHAIN-CERTO series, a **calibration chart** documents the position error over the measuring range. It also shows the measuring step and the measuring uncertainty of the calibration measurement.

For HEIDENHAIN-METRO gauges the calibration chart shows the mean value of one forward and one backward measuring stroke.

The HEIDENHAIN-CERTO calibration chart shows the envelope curve of the measured error. The HEIDENHAIN-CERTO length gauges are supplied with two calibration charts, each for different operating attitudes.

Example

Temperature range

The length gauges are inspected at a **reference temperature** of 20 °C. The system accuracy given in the calibration chart applies at this temperature.

The **operating temperature** indicates the ambient temperature limits between which the length gauges will function properly. The **storage temperature range** of -20 °C to 60 °C applies for the device in its packaging.

Repeatability

Whereas the system accuracy applies over the entire measuring range, for some applications the repeatability is the decisive factor. It plays an important role in repeated measurements.

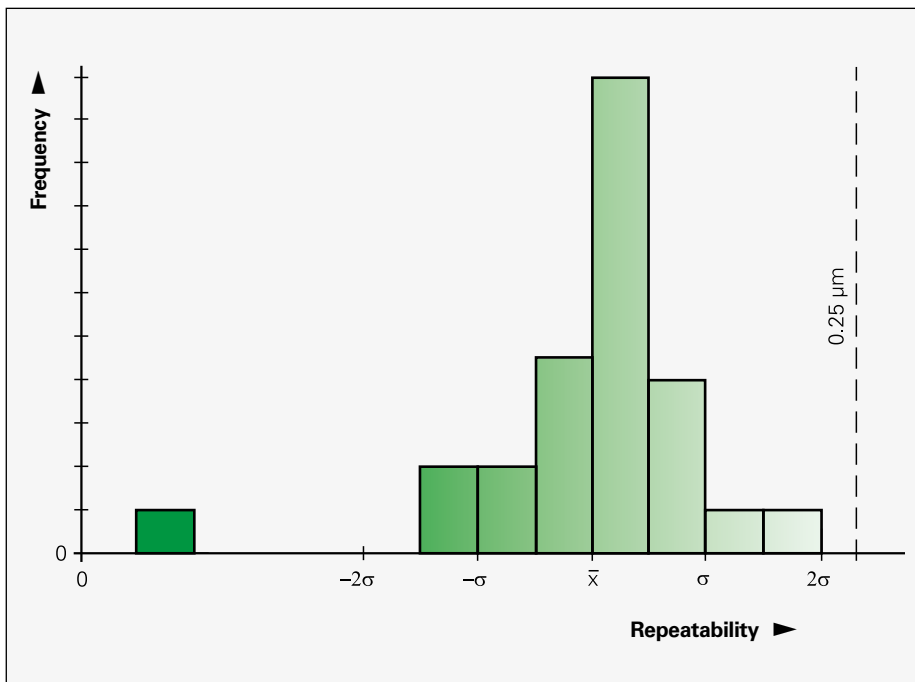

Repeatability is defined in the standards DIN 32876 and DKD-R 4-3, and describes a length gauge's capability to supply very similar measured values for identical measurands and conditions.

HEIDENHAIN ascertains the repeatability of the length gauges with five measurements near the lower plunger stop. The plunger is completely extended and retracted at medium speed. Since the length gauge was already in operation for at least 10 minutes before this, it is already in a stable thermal state.

The repeatability of the length gauges is usually better than the values listed in the table. The characteristic statistical distribution is shown in the diagram, using the ST 1200 as an example.

- Repeatability depends on the
- combinations of materials used in the components,
 - installed electronics,
 - optomechanics used, and the
 - bearing of the plunger.

Series	Repeatability < $\bar{x} \pm 2\sigma$
AT 1200	0.4 μm
AT 3000	0.8 μm

MT 60	0.06 μm
ST 1200	0.25 μm
ST 3000	0.7 μm

ST 1200: Statistical distribution of the repeatability

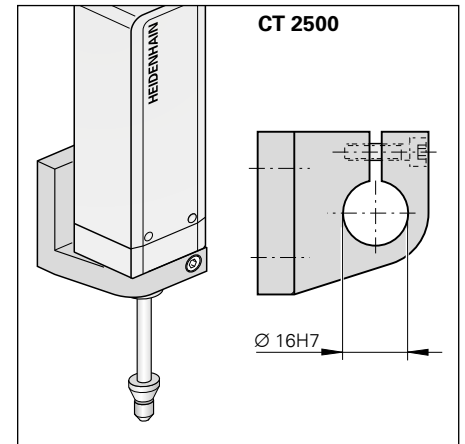

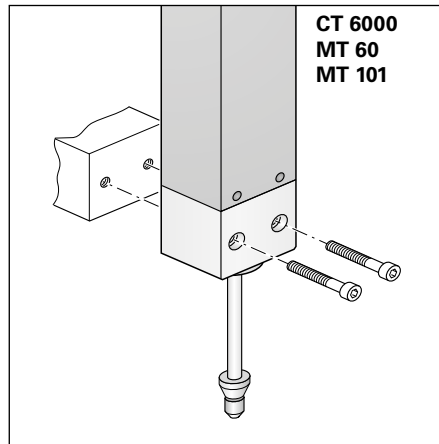

Mounting

Abbe principle

HEIDENHAIN length gauges enable you to work according to the Abbe measuring principle: The measured object and scale must be in alignment to avoid additional measuring error.

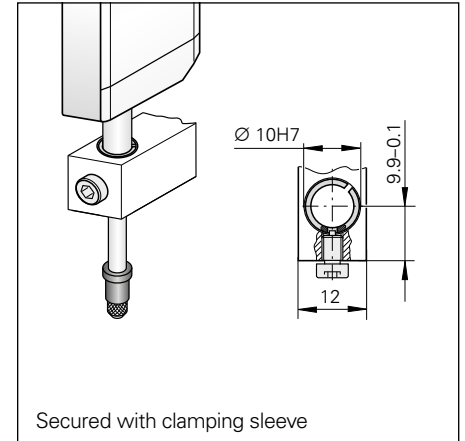

Fastening

The **CT 6000**, **MT 60** and **MT 101** length gauges are fastened by two screws onto a plane surface. This ensures a mechanically stable installation of even these large length gauges. Special holders are available for fastening the MT 60 and MT 101 to the MS 100 gauge stand for the HEIDENHAIN-METRO (see *Accessories*).

The **CT 2500** is mounted by its standard clamping shank with 16h8 diameter. A holder is available for fastening the HEIDENHAIN-CERTO to the gauge stand (see *Accessories*).

The **AT**, **ST**, **MT 1200** and **MT 2500** length gauges feature a standard clamping shank with 8h6 diameter. These HEIDENHAIN length gauges can therefore easily be used with existing measuring fixtures and stands.

As an accessory, HEIDENHAIN offers a special clamping sleeve and screw. It facilitates fastening the length gauge securely without overstressing the clamping shank.

Clamping sleeve ID 386811-01

mm

 Tolerancing ISO 8015
 ISO 2768 - m H
 < 6 mm: ±0.2 mm

Operating attitude for HEIDENHAIN-CERTO

The HEIDENHAIN-CERTO can be operated at any attitude. However, the mounting position with horizontal length gauge and upward facing mounting surface should be avoided because in such a case no guarantee can be made for accuracy.

Setup

HEIDENHAIN length gauges function according to the **Abbe measuring principle**, i.e. the measuring standard and the plunger are exactly aligned. All components comprising the **measuring loop**, such as the measuring standard, plunger, holder and scanning head are designed in terms of their mechanical and thermal stability for the highest possible accuracy of the length gauge.

The **plungers** of the HEIDENHAIN length gauges are locked against rotation. Their optimally round form stays unchanged while stability and thermoconductivity remain unimpaired. They are provided with an M2.5 thread to hold measuring contacts (see *Accessories*)

The plungers of the HEIDENHAIN-ACANTO and HEIDENHAIN-SPECTO ST 1200 length gauges are protected by a rubber bellows. The **bellows** are characterized by high resistance to chemical and thermal influences and have a relatively low stiffness. Its influence on the gauge's mechanical behavior and the measuring force is therefore low.

Thermal characteristics

HEIDENHAIN length gauges have a defined thermal behavior. Since temperature variations during measurement can result in changes in the measuring loop, HEIDENHAIN uses special materials with low coefficients of expansion α_{therm} for the components of the measuring loop, for example in the HEIDENHAIN-CERTO length gauges. The scale is manufactured of Zerodur ($\alpha_{\text{therm}} \approx 0 \text{ K}^{-1}$), and the plunger and holder are of Invar ($\alpha_{\text{therm}} \approx 1 \times 10^{-6} \text{ K}^{-1}$). This makes it possible to guarantee its high measuring accuracy over a relatively large temperature range.

Acceleration

Length gauges from HEIDENHAIN feature a **sturdy design**. Even high vibration and shock loads have no negative influence on the accuracy.

However, shock and vibration of any kind is to be avoided during measurement so as not to impair the high accuracy of measurement. The maximum values given in the specifications for shock and vibration apply to the effect of external acceleration on the length gauge. They describe only the mechanical stability of the length gauge, and imply no guarantee of function or accuracy.

In the length gauge itself, unchecked extension of the spring-driven or non-coupled moving plunger can cause high acceleration onto the measured object or measuring plate surface. For the MT 1200 and MT 2500 series length gauges, use the cable-type lifter whenever possible (see *Accessories*). The cable lifter features adjustable pneumatic damping to limit the extension velocity to an uncritical value.

Plunger guideway

HEIDENHAIN length gauges are available with various plunger guides.

The plungers of the HEIDENHAIN-ACANTO length gauges work with **sliding guides**.

The sliding guides have the following properties:

- Sturdiness thanks to few moving parts
- High tolerance to shock and vibration
- High plunger speeds and long service life thanks to high-quality ceramic bearings
- Less sensitivity to improper clamping

The HEIDENHAIN-METRO, HEIDENHAIN-CERTO, and HEIDENHAIN-SPECTO length gauges are equipped with a **ball-bush guide**. The following are some of the basic properties of ball guides in HEIDENHAIN length gauges:

- Low friction, which makes versions of length gauges with reduced gauging force possible
- Safe plunger extension and retraction even with high radial force
- High precision of the measuring loop thanks to a guide that is free of play (the bearing and plunger are specially fitted during manufacture)

Expendable parts

HEIDENHAIN length gauges contain components that are subject to wear, depending on the application and handling. These include in particular the following parts:

- Guideway (tested for at least 60 million strokes*)
- Cable link for CT, MT 60 and MT 101 (tested for at least 1 million strokes*)
- Scraper rings
- Rubber bellows for AT and ST 1200

* With CT, MT 60 M and MT 101 M only with actuation by switch box

Ball-bush guide

Gauging force – plunger actuation

Gauging force

Gauging force is the force that the plunger exerts on the measured object. An excessively large gauging force can cause deformation of the measuring contact and the measured object. If the gauging force is too small, an existing dust film or other obstacle may prevent the plunger from fully contacting the measured object. The gauging force depends on the type of plunger actuation.

Plunger actuation by spring

For the AT 1218, AT 3018, MT 12x1, MT 25x1, ST 12x8 and ST 30x8, the integral spring extends the plunger to the measuring position and applies the **gauging force**. In its resting position, the plunger is extended. The gauging force depends on the following criteria:

- The operating attitude
- The plunger position, i.e. the force changes over the measuring range
- The measuring direction, i.e., whether the gauge measures with extending or retracting plunger

In the diagrams, the measuring force is shown over the measuring range for a retracting and extending plunger in a horizontal operating attitude.

The MT 1281 and ST 1288 length gauges are available with various gauging forces. Particularly for fragile materials this makes it possible to measure without deformation.

The gauging forces can be divided into the following classes:

- Reduced MR: Approx. half the gauging force of the standard variant.
- Low MW: Gauging force at the beginning of the measuring range, approx 0.01 N
- Springless MG: Constant gauging force over the entire measuring range

In order not to influence the gauging force, the variants ST 1288MR and ST 1288MG are provided without a rubber bellows. Due to their low gauging force, the variants MT 1281 MW, MT 1281 MG and ST 1288MG can only be used for measuring vertically downward. For this reason, the diagram shows only gauging forces for a vertical operating orientation.

Plunger actuation by measured object

The complete length gauge is moved relative to the measured object, normally while the plunger retracts.

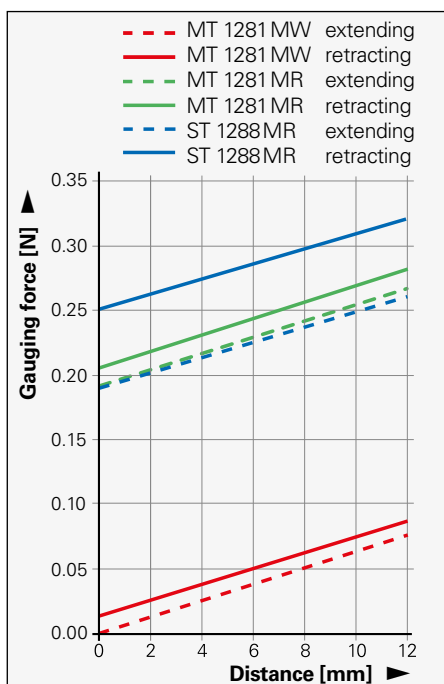

Plunger actuation via cable-type lifter (MT 12x1, MT 25x1)

Through a cable mechanism, the plunger is retracted by hand and then extended onto the measured object. The measurement is made with extending plunger.

The integral pneumatic damping reduces the plunger extension speed to prevent bouncing, for example on very hard materials. This prevents measuring error through bouncing.

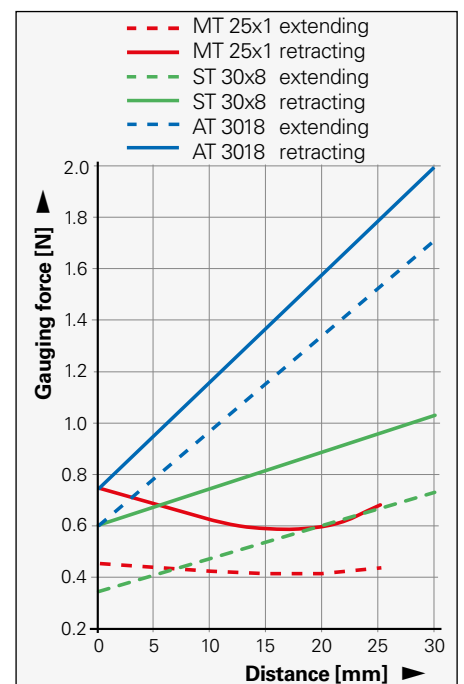

Special variants

12 mm measuring range

25 mm/30 mm measuring range

Pneumatic plunger actuation

The pneumatically actuated plungers of the AT 1217, AT 3017, MT 1287, MT 2587, ST 12x7 and ST 30x7 length gauges are extended by the application of compressed air. When the air connection is ventilated, the integral spring retracts the plunger to a protected resting position within the housing.

The **gauging force** can be adjusted to the measuring task through the level of air pressure. At constant pressure, it depends on the operating attitude and the plunger position.

The diagrams show the respective measuring force for a horizontal operating attitude depending on the working pressure applied with the plunger fully extended and fully retracted. These are approximate values that are subject to changes due to tolerances and depend on seal wear.

The working pressure defines the pressure range of the first complete plunger extension up to the maximum specified range.

Note

The compressed air introduced directly into the length gauges must be properly conditioned and must comply with the following quality classes as per **ISO 8573-1** (1995 edition):

- Solid contaminants Class 1 (max. particle size 0.1 μm and max. particle density 0.1 mg/m^3 at $1 \cdot 10^5$ Pa)
- Total oil content: Class 1 (max. oil concentration 0.01 mg/m^3 at $1 \cdot 10^5$ Pa)
- Max. pressure dew point: Class 4, but with reference conditions of $+3$ °C at $2 \cdot 10^5$ Pa

HEIDENHAIN offers the **DA 400 compressed air unit** for purifying compressed air. The minimum flow rate is 10 l/min.

For more information, ask for our **DA 400** Product Information Sheet.

12 mm measuring range
(pneumatically actuated)

25 mm/30 mm measuring range
(pneumatically actuated)

Except for special variants, the diagrams apply for the **horizontal operating attitude**. The following compensation values are to be taken into account for other operating attitudes.

Type	Operating attitude vertical	
	North	South
AT 121x AT 301x	- 0.12 N - 0.18 N	+ 0.12 N + 0.18 N
MT 12xx MT 25x1 MT 2587	- 0.13 N - 0.17 N - 0.19 N	+ 0.13 N + 0.17 N + 0.19 N
ST 12x7 ST 12x8 ST 30xx	- 0.07 N - 0.08 N - 0.11 N	+ 0.07 N + 0.08 N + 0.11 N

Motorized plunger actuation

The CT 2501, CT 6001, MT 60M and MT 101 M length gauges feature an integral motor that moves the plunger. It is operated through the switch box either by push button or over the connection for external actuation. The plungers of the CT 2501, CT 6001 and MT 60M length gauges must not be moved by hand if the switch box is connected.

The **gauging force** of the CT 2501, CT 6001, and MT 60 M motorized length gauges is adjustable in three stages through the switch box. The force remains constant over the measuring range but depends on the operating attitude. Regardless of the operating attitude—whether it measures vertically downward (with the SG 101 V switch box) or horizontally (with the SG 101 H switch box)—the MT 101 M exercises a constant gauging force.

	CT 2501 CT 6001	MT 60M	MT 101 M
Gauging force	By motor	By motor	By motor
Vertically downward	1 N/1.25 N/1.75 N	1 N/1.25 N/1.75 N	0.7 N with SG 101V
Vertically upward	-/-/0.75 N	-/-/0.75 N	-
Horizontal	-/0.75 N/1.25 N	-/0.75 N/1.25 N	0.7 N with SG 101 H

External plunger actuation by coupling

For the CT 2502, CT 6002, MT 60K, MT 101 K and special versions (without spring) of the MT 1200, MT 2500, and ST 1288, the plunger is freely movable. For position measurement, the plunger is connected by a coupling with a moving machine element. The force needed to move the plunger is specified as the required **moving force**. It depends on the operating attitude.

	CT 2502 CT 6002	MT 60K	MT 101K	MT 1271 \square TTL MT 1281 \sim 1 V _{PP}	MT 2571 \square TTL MT 2581 \sim 1 V _{PP}	ST 1288

Interface electronics

Interface electronics from HEIDENHAIN adapt the encoder signals to the interface of the subsequent electronics. They are used when the subsequent electronics cannot directly process the output signals from HEIDENHAIN encoders, or if additional interpolation of the signals is necessary.

Input signals of the interface electronics

Interface electronics from HEIDENHAIN can be connected to encoders with sinusoidal signals of $1 V_{PP}$ (voltage signals) or $11 \mu A_{PP}$ (current signals). Encoders with the serial interfaces EnDat or SSI can also be connected to various interface electronics.

Output signals of the interface electronics

Interface electronics with the following interfaces to the subsequent electronics are available:

- TTL square-wave pulse trains
- EnDat 2.2
- DRIVE-CLiQ
- Fanuc Serial Interface
- Mitsubishi high speed interface
- Yaskawa Serial Interface
- Profibus

Interpolation of the sinusoidal input signals

In addition to being converted, the sinusoidal encoder signals are also interpolated in the interface electronics. This permits finer measuring steps and, as a result, higher control quality and better positioning behavior.

Formation of a position value

Some interface electronics have an integrated counting function. Starting from the last reference point set, an absolute position value is formed when the reference mark is traversed, and is transferred to the subsequent electronics.

Evaluation electronics units

For measuring and testing tasks

Evaluation electronics from HEIDENHAIN combine measured value acquisition with intelligent, application-specific further processing. They are used in many metrological applications, ranging from simple measuring stations to complex inspection systems with multiple measuring points.

Evaluation units feature interfaces for various encoder signals. They include units with integrated display—which can be used independently—and units that require a PC for operation.

The overview table lists evaluation electronics for measuring and testing tasks. You can find comprehensive information, including on other evaluation units for 2-D and 3-D measuring tasks, on the Internet under www.heidenhain.de or in the product catalog *Evaluation Electronics for Metrology Applications*.

Digital readouts for manual machine tools optimally support the operator with cycles for milling, drilling and turning. You can find these digital readouts on the Internet at www.heidenhain.de or in the product catalog *Digital Readouts and Linear Encoders for Manually Operated Machine Tools*.

Interfaces

Incremental signals $\sim 11 \mu A_{PP}$

HEIDENHAIN encoders with $\sim 11 \mu A_{PP}$ interface provide current signals. They are intended for connection to ND position display units or EXE pulse-shaping electronics from HEIDENHAIN.

The sinusoidal **incremental signals** I_1 and I_2 are phase-shifted by 90° elec. and have signal levels of typically $11 \mu A_{PP}$. The illustrated sequence of output signals— I_2 lagging I_1 —applies for the retracting plunger.

The **reference mark signal** I_0 has an unambiguous assignment to the incremental signals.

The *Interfaces of HEIDENHAIN Encoders* brochure, ID 1078628-xx, includes comprehensive descriptions of all available interfaces as well as general electrical information.

U_P = Power supply
Vacant pins or wires must not be used!

Shield on housing
Color assignment applies only to extension cable.

Interfaces

Incremental signals $\sim 1 V_{PP}$

HEIDENHAIN encoders with $\sim 1 V_{PP}$ interface provide voltage signals that can be highly interpolated.

The sinusoidal **incremental signals** A and B are phase-shifted by 90° elec. and have amplitudes of typically $1 V_{PP}$. The illustrated sequence of output signals—with B lagging A—applies for the direction of motion shown in the dimension drawing.

The **reference mark signal** R has an unambiguous assignment to the incremental signals. The output signal might be somewhat lower next to the reference mark.

The *Interfaces of HEIDENHAIN Encoders* brochure, ID 1078628-xx, includes comprehensive descriptions of all available interfaces as well as general electrical information.

Sensor: The sensor line is connected in the encoder with the corresponding power line.

Vacant pins or wires must not be used!

Color assignment applies only to extension cable.

Incremental signals

HEIDENHAIN encoders with TTL interface incorporate electronics that digitize sinusoidal scanning signals with or without interpolation.

The **incremental signals** are transmitted as the square-wave pulse trains U_{a1} and U_{a2} , phase-shifted by 90° elec. The **reference mark signal** consists of one or more reference pulses U_{a0} , which are gated with the incremental signals. In addition, the integrated electronics produce their **inverted signals** $\overline{U_{a1}}$, $\overline{U_{a2}}$ and $\overline{U_{a0}}$ for noise-proof transmission. The illustrated sequence of output signals—with U_{a2} lagging U_{a1} —applies to the direction of motion shown in the dimension drawing.

The **fault detection signal** $\overline{U_{aS}}$ indicates fault conditions such as an interruption in the supply lines, failure of the light source, etc.

The distance between two successive edges of the incremental signals U_{a1} and U_{a2} through 1-fold, 2-fold or 4-fold evaluation is one **measuring step**.

The *Interfaces of HEIDENHAIN Encoders* brochure, ID 1078628-xx, provides comprehensive descriptions of all available interfaces as well as general electrical information.

Interfaces

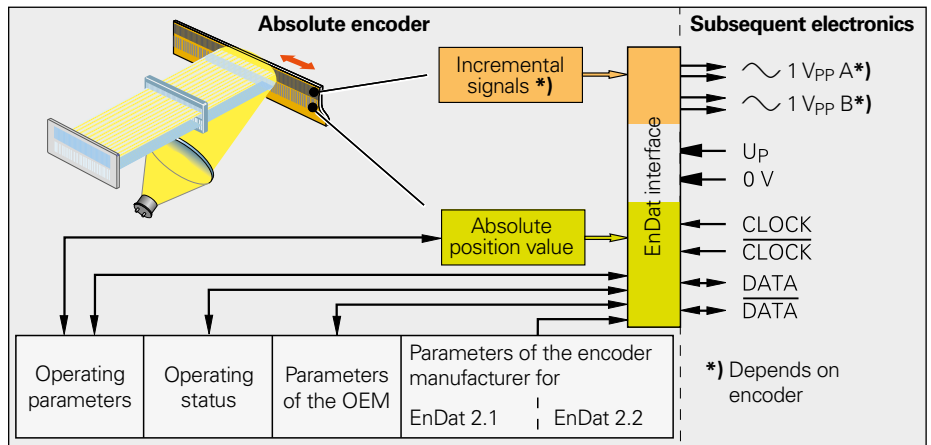

Position values

The EnDat interface is a digital, **bidirectional** interface for encoders. It is capable both of transmitting **position values** as well as transmitting or updating information stored in the encoder, or saving new information. Thanks to the **serial transmission method**, only **four signal lines** are required. The DATA data is transmitted in **synchronism** with the CLOCK signal from the subsequent electronics. The type of transmission (position values, parameters, diagnostics, etc.) is selected through mode commands that the subsequent electronics send to the encoder. Some functions are available only with EnDat 2.2 mode commands.

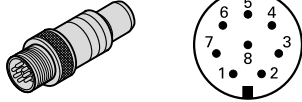

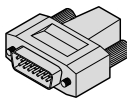

The *Interfaces of HEIDENHAIN Encoders* brochure, ID 1078628-xx, includes comprehensive descriptions of all available interfaces as well as general electrical information.

Calibration according to DAkkS

As part of the quality management standard ISO 9001, inspection equipment relevant to quality must be monitored regularly, and must also be traceable to a national standard in concordance with the International System of Units (SI).

HEIDENHAIN supports its customers in this task with its own calibration laboratory for digital linear and angle encoders, which has been accredited since 1994.

The **calibration laboratory at HEIDENHAIN** operates according to DIN EN ISO/IEC 17025, and has been accredited by the German Accreditation Body (DAkkS).

HEIDENHAIN calibration certificates—granted by the accredited laboratory—document the traceability to the International System of Units (SI).

The DAkkS is a signatory to the multilateral agreement of the European co-operation for Accreditation (EA) and of the International Laboratory Accreditation Cooperation (ILAC) for the mutual recognition of calibration certificates.

Calibration certificates from HEIDENHAIN are recognized in most industrial countries.

The calibration certificate from HEIDENHAIN gives the user certainty about the accuracy of the encoder, and also certifies the traceability to the International System of Units (SI) necessary for ISO 9001.

The calibration laboratory at HEIDENHAIN is equipped for all **digital linear and angle encoders** where accuracy is of extreme importance:

- AT, CT, MT, ST and length gauges (also in conjunction with ND 28x, EXE or IBV subsequent electronics)
- LC, LF, LIDA, LIP, and LS linear encoders
- ECN, ROC, ROD, and RON angle encoders

Length gauges from HEIDENHAIN can be calibrated no matter what interface they have. If the measuring chain includes a subsequent electronics unit from HEIDENHAIN, this unit can also be included in the calibration.

The following are measured and certified:

- Deviation span with retracting plunger
- Deviation span in the part measuring span
- Repeatability with five measurements (extended plunger)
